A detailed map of Antarctica showing its various landmasses, ice shelves, and mountain ranges. The map is labeled with geographical names such as Dronning Maud Land, East Antarctica, West Antarctica, and the Transantarctic Mountains. It also shows the South Pole, the Amundsen-Scott station, and various ice shelves like the Ronne and Ross Ice Shelves. The map includes latitude and longitude lines, with the Antarctic Circle and the 80°S line clearly marked. The surrounding seas, including the Weddell Sea and Amundsen Sea, are also labeled.

# The CO<sub>2</sub> Answer in 6 Easy Steps

A presentation based on the RealClimate post

[realclimate.org/index.php/archives/2007/08/the-co2-problem-in-6-easy-steps/](http://realclimate.org/index.php/archives/2007/08/the-co2-problem-in-6-easy-steps/)

# Learning Objectives

- Explain the difference between predictions and data
- Describe how greenhouse gases affect surface temperature and the effect of changing the greenhouse gas effectiveness (1)
- Understand how spectroscopy measures the radiative transfer absorbed by trace greenhouse gases (2)
- Demonstrate the context of industrial age concentrations of trace greenhouse gases (3)
- Use radiative forcing and climate sensitivity to calculate how the environment reacts to change (4, 5, 6 )

# Quiz: Heat Transfer (Part One)

For each of these three mechanisms:

- Conduction
- Convection
- Radiation

What percentage is it of the total heat transfer  
**from the Sun to the Earth?**

eesc.columbia.edu

**Solar “constant,” mean total solar irradiance,  
 $TSI = 1366 \text{ W/m}^2$  ( $1.36 \times 10^6 \text{ erg/cm}^2 \text{ sec}$ )**

**Instantaneous insolation cycles daily, annually;  
 obliquity, eccentricity, changes cycle long term.**

# Quiz: Heat Transfer (Part Two)

- Conduction
- Convection
- Radiation

Which one of these three mechanisms is **100%** of the total heat transfer from the Earth to space?

# The CO<sub>2</sub> Answer in 6 Easy Steps

## 1. There is a natural greenhouse effect

[realclimate.org/index.php/archives/2007/08/the-co2-problem-in-6-easy-steps/](http://realclimate.org/index.php/archives/2007/08/the-co2-problem-in-6-easy-steps/)

Mean surface temperature,  $T_s$ ,  $\sim 15^\circ\text{C}$

produces upward surface flux of longwave radiation

$$G = \sigma T_s^4 \cong 390 \frac{\text{W}}{\text{m}^2}$$

Stefan-Boltzmann constant:  
 $\sigma = \frac{2\pi^5 k^4}{15c^2 h^3} = 5.67 \times 10^{-8} \text{ Wm}^{-2}\text{K}^{-4}$

Net solar radiation absorbed

$$S = \frac{(1 - a)TSI}{4} \cong 240 \frac{\text{W}}{\text{m}^2}$$

$a = 0.306$   
 $TSI = 1366 \text{ W/m}^2$

means  $240 \text{ W/m}^2$  of longwave radiation is emitted

Atmosphere must absorb  **$150 \text{ W/m}^2$**  net

a number that would be zero without greenhouse gases

[realclimate.org/index.php/archives/2007/08/the-co2-problem-in-6-easy-steps/](http://realclimate.org/index.php/archives/2007/08/the-co2-problem-in-6-easy-steps/)

<http://www.esrl.noaa.gov/gmd/ccgg/trends/history.html>

# The CO<sub>2</sub> Answer in 6 Easy Steps

- 3. The trace greenhouse gases have increased markedly due to human emissions**

# The CO<sub>2</sub> Answer in 6 Easy Steps

- 4. Radiative forcing is a useful diagnostic and can easily be calculated**

## If the sun became stronger by 2%

TOA radiation balance would change by

$$0.02 \times 1366 \times 0.7/4 = 4.8 \text{ W/m}^2$$

(taking albedo and geometry into account)

This is the radiative forcing (RF). Changes in greenhouse absorbers, albedo have analogous impacts

$$S = \frac{(1-a)TSI}{4}$$

$$\cong 245 \text{ W/m}^2$$

$$T_s = \sqrt[4]{\frac{(1-a)TSI}{4\sigma(1-0.5\lambda)}}$$

$$T_s \cong 289.5^\circ\text{K} = 16.5^\circ\text{C}$$

$$a = 0.306$$

$$TSI = 1366 \text{ W/m}^2$$

$$\sigma = 5.67 \times 10^{-8} \text{ Wm}^{-2}\text{K}^{-4}$$

$$\lambda = 0.769$$

Line-by-line codes accounting for atmospheric profiles of temperature, water vapor, and aerosols.

Simplified fits to the data, such as for CO<sub>2</sub>

$$RF = 5.35 \ln\left(\frac{CO_2}{CO_{2\text{ orig}}}\right) W/m^2$$

Logarithmic because some particular lines are already saturated.

Forcings for lower concentration gases (such as CFCs) are linear in concentration.

RF for a doubling of CO<sub>2</sub> is likely  $3.7 \pm 0.4 \frac{W}{m^2}$

Same order of magnitude as 2% increase of solar forcing

Total forcing from trace greenhouse gases mentioned in Step 3, is currently about  **$2.5 \text{ W/m}^2$**

Net forcing (including cooling impacts of aerosols and natural changes) is  **$1.6 \pm 1.0 \text{ W/m}^2$**  since pre-industrial.

- uncertainty mostly related to aerosol effects.

Current forcings growth dominated by increasing  $\text{CO}_2$ , with potentially a small role for

- decreases in reflective aerosols (sulphates, particularly in the US and EU)
- increases in absorbing aerosols (like soot, particularly from India and China and from biomass burning)

Step 3 - “ $\text{CO}_2$  is up more than 30%,  $\text{CH}_4$  has more than doubled,  $\text{N}_2\text{O}$  is up 15%, tropospheric  $\text{O}_3$  has also increased. New compounds such as halocarbons (CFCs, HFCs) did not exist in the pre-industrial atmosphere.”

# The CO<sub>2</sub> Answer in 6 Easy Steps

4. Radiative forcing is a useful diagnostic and can easily be calculated

# The CO<sub>2</sub> Answer in 6 Easy Steps

- 5. Climate sensitivity is around 3 C° for a doubling of CO<sub>2</sub>**

[realclimate.org/index.php/archives/2007/08/the-co2-problem-in-6-easy-steps/](http://realclimate.org/index.php/archives/2007/08/the-co2-problem-in-6-easy-steps/)

**Climate sensitivity** is response of global mean

temperature to forcing,  $\frac{C^{\circ}}{W/m^2}$

**after** 'fast feedbacks' have occurred (atmospheric temperatures, clouds, water vapor, winds, snow, sea ice etc.)

**before** 'slow' feedbacks have started (ice sheets, vegetation, carbon cycle etc.)

Sensitivity can be assessed from any particular period in the past where

**changes in forcing** are known

corresponding equilibrium **temperature change** can be estimated

[realclimate.org/index.php/archives/2007/08/the-co2-problem-in-6-easy-steps/](http://realclimate.org/index.php/archives/2007/08/the-co2-problem-in-6-easy-steps/)

Last glacial period had large forcing,  **$\sim 7 \text{ W/m}^2$**   
from ice sheets, greenhouse gases, dust and vegetation

Large temperature response,  **$\sim 5 \text{ }^\circ\text{C}$**

implying a sensitivity of about  **$3 \text{ }^\circ\text{C}$**  with error

$$\mathbf{3.7 \text{ W/m}^2 \times 5 \text{ }^\circ\text{C} / 7 \text{ W/m}^2 = 2.6 \text{ }^\circ\text{C}}$$

Provided link to 2006 estimate of response to volcanoes, the last millennium, remote sensing etc. which was also  **$3 \text{ }^\circ\text{C}$** .

“Converting the estimate for doubled  $\text{CO}_2$  to a more useful factor gives  **$\sim 0.75 \text{ }^\circ\text{C}/(\text{W/m}^2)$** ”

$$\mathbf{3 \text{ }^\circ\text{C} / 3.7 \text{ W/m}^2 = 0.81 \text{ }^\circ\text{C}/(\text{W/m}^2)}$$

$$\mathbf{5 \text{ }^\circ\text{C} / 7 \text{ W/m}^2 = 0.71 \text{ }^\circ\text{C}/(\text{W/m}^2)}$$

$$\mathbf{1.5 \text{ }^\circ\text{C} / 5 \text{ W/m}^2 = 0.3 \text{ }^\circ\text{C}/(\text{W/m}^2)}$$

# The CO<sub>2</sub> Answer in 6 Easy Steps

5. **Climate sensitivity is around 3 C° for a doubling of CO<sub>2</sub>**

# The CO<sub>2</sub> Answer in 6 Easy Steps

- 6. Radiative forcing x climate sensitivity is a significant number**

Current forcings;  **$1.6 \text{ W/m}^2 \times 0.75 \text{ }^\circ\text{C}/(\text{W/m}^2) = 1.2 \text{ }^\circ\text{C}$**   
at equilibrium. Oceans take time to warm up, air is only up  **$0.7^\circ\text{C}$**   
Remaining  **$0.5 \text{ }^\circ\text{C}$**  ‘in the pipeline’.

Also estimated using changes in ocean heat content over last decade (about equal to radiative imbalance) of  **$\sim 0.7 \text{ W/m}^2$** ,  
implying that this ‘unrealised’ forcing will lead to another  
 **$0.7 \text{ W/m}^2 \times 0.75 \text{ }^\circ\text{C}/(\text{W/m}^2) \cong 0.5 \text{ }^\circ\text{C}$**

Additional forcings in business-as-usual scenarios range roughly  
from  **$3 \text{ to } 7 \text{ W/m}^2$**

Additional warming at equilibrium would be  **$2 \text{ to } 5 \text{ }^\circ\text{C}$** .

[realclimate.org/index.php/archives/2007/08/the-co2-problem-in-6-easy-steps/](http://realclimate.org/index.php/archives/2007/08/the-co2-problem-in-6-easy-steps/)
